## Abstract

Economic and social inequalities have generated growing concern and crises across contemporary societies

## 1. Probando markdown

I think most people start using R with scripts initially. Scripts are great for modular computational tasks, but for generating informative reports, Rmarkdown is a must. Rmd makes it possible to use a YAML header to specify certain parameters right at the beginning of the document. Built-in YAML parameters make it easier to create more organized and informative reports. In this post, I will share with you few of the YAML options I commonly use for generating HTML outputs in my data analysis projects. You can check out the following resources for details about tons of other options:

## Segundo encabezado

$$\beta_0$$

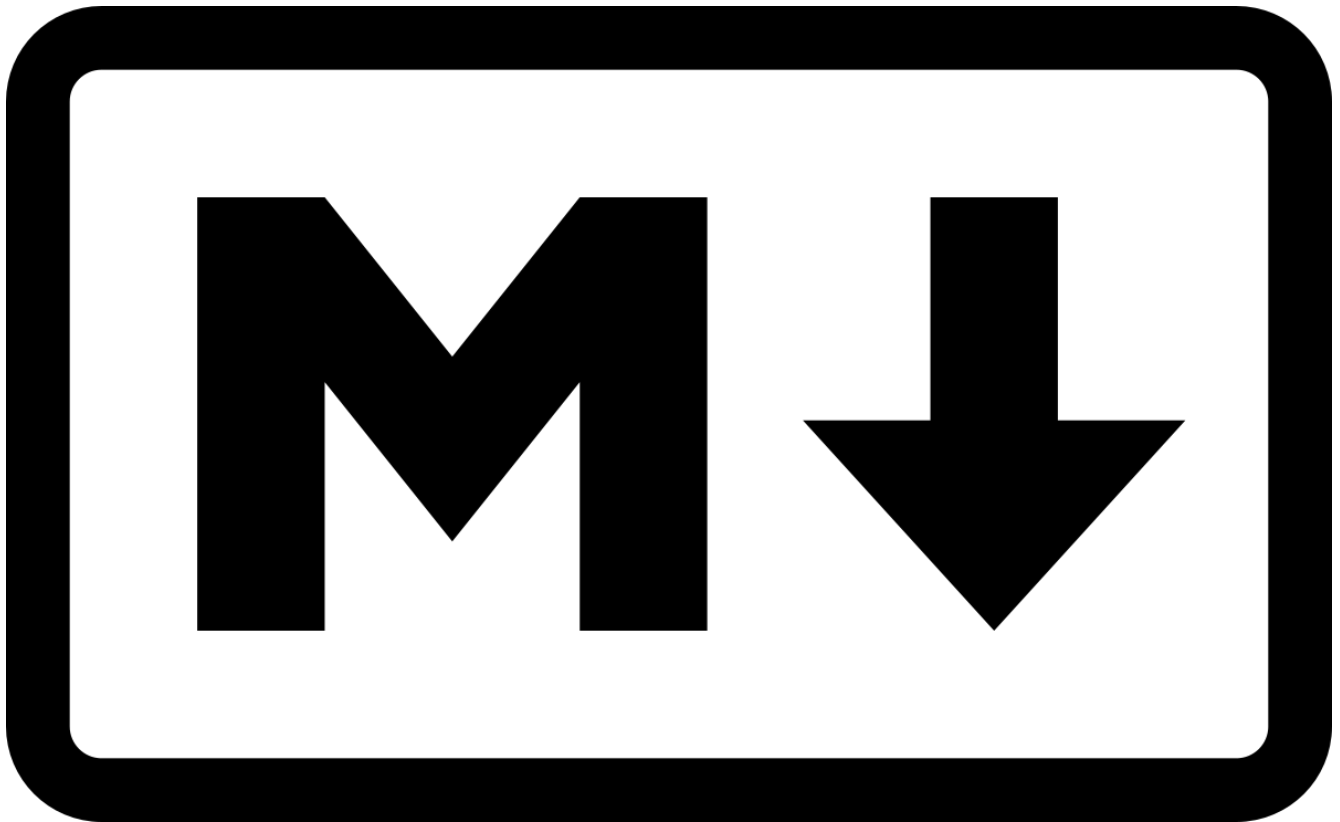

## Probando negrita fdfd

1. *cursiva* fdfd fdf
2. fsdf
3. fsdf
- 4.

| Fila 1  | Fila 2  | Fila 3  |
|---------|---------|---------|
| celda 1 | celda 2 | celda 3 |

## Probando Imágenes

Insertar imagen con ![] (Markdown-mark.png) :

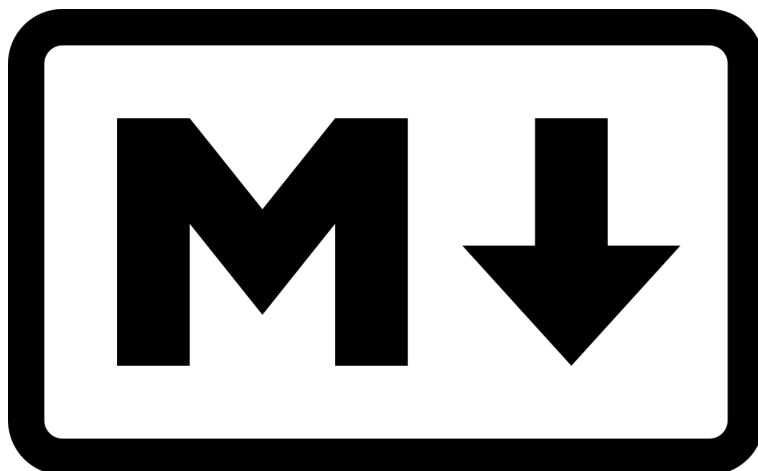

Esto funciona tanto para salida en html como Latex/pdf. El problema es el tamaño y centrado de la imagen. La solución más rudimentaria es incluir código de html y latex que permita hacer esto.

- En el caso de **html**: ``

Y si se desea centrada:

```
<center></center>
```

- En el caso de pdf (Latex)
